NEW QUESTION: 1

You plan to migrate a Microsoft SQL server instance between physical servers.

You must migrate the metadata associated with the database instance.

You need to ensure that the new instance retains the existing jobs and alerts.

Solutions: You restore the service master key.

Does the solution meet the goal?

A. Yes

B. No

Answer: B

Explanation:

Explanation/Reference:

Explanation:

The Service Master Key is the root of the SQL Server encryption hierarchy. It does not handle alerts and jobs.

The msdb database is used by SQL Server Agent for scheduling alerts and jobs and by other features such as SQL Server Management Studio, Service Broker and Database Mail.

NEW QUESTION: 2

3つの仮想マシン間でポート80と443のバランスをとるパブリックロードバランサーがあります。すべてのリモートデスクトッププロトコル（RDP）接続をVM3のみに送信する必要があります。何を設定する必要がありますか？

A. VM3の新しいパブリックロードバランサー

B. フロントエンドIP構成

C. インバウンドNATルール

D. 負荷分散ルール

Answer: C

Explanation:

Explanation

To port forward traffic to a specific port on specific VMs use an inbound network address translation (NAT) rule.

<https://docs.microsoft.com/en-us/azure/load-balancer/load-balancer-overview> an inbound NAT rule :

Create a load balancer inbound network address translation (NAT) rule to forward traffic from a specific port of the front-end IP address to a specific port of a back-end VM.

Hence this option is Correct

a load balancing rule : Incorrect Choice

A load balancer rule defines how traffic is distributed to the VMs. The rule defines the front-end IP configuration for incoming traffic, the back-end IP pool to receive the traffic, and the required source and destination ports.

a new public load balancer for VM3 : Incorrect Choice

This option will not help you since this will route all traffic to VM3 only.

a frontend IP configuration : Incorrect Choice

When you define an Azure Load Balancer, a frontend and a backend pool configuration are connected with rules. The health probe referenced by the rule is used to determine how new flows are sent to a node in the backend pool. The frontend (aka VIP) is defined by a 3-tuple comprised of an IP address (public or internal), a transport protocol (UDP or TCP), and a port number from the load balancing rule. The backend pool is a collection of Virtual Machine IP configurations (part of the NIC resource) which reference the Load Balancer backend pool.

NEW QUESTION: 3

A, B and C are 3 consecutive points on an arc with a constant radius. What is the distance between A and C?

(1) The radius of the arc is 25 Cm.

(2) The length of AB is 5 Cm.

A. Statement (1) BY ITSELF is sufficient to answer the question, but statement (2) by itself is not.

B. Statements (1) and (2) TAKEN TOGETHER are NOT sufficient to answer the question, requiring more data pertaining to the problem.

C. Statements (1) and (2) TAKEN TOGETHER are sufficient to answer the question, even though NEITHER statement BY ITSELF is sufficient.

D. Either statement BY ITSELF is sufficient to answer the question.

E. Statement (2) BY ITSELF is sufficient to answer the question, but statement (1) by itself is not.

Answer: B

Explanation:

Explanation/Reference:

Explanation:

In order to know the distance between two points on an arc you need to know the angle that the points make and the radius of the arc.

Statement (1) gives us the radius.

Statement (2) gives us the length of AB, but the question didn't mention that there is equal spacing and therefore the length of BC can't be found with both of the statements taken together.
