NEW QUESTION: 2

Your network contains an Active directory domain named fabrikam.com. The domain contains a Web server named Web1 that runs Windows Server 2008 R2.

You create three application pools named AppPool1, AppPool2, and AppPool3.

You need to recycle AppPool1 without affecting AppPool2 and AppPool3.

Which tool should you use?

- A. Internet Information Services (IIS) Manager
- B. Internet Information Services (IIS) 6.0 Manager
- C. Services
- D. IISRESET

Answer: A

Explanation:

Occasionally, you may have to immediately recycle an unhealthy worker process instead of waiting for the next configured recycle. Rather than abruptly stopping the worker process, which can cause service interruptions, you can use on-demand recycling. Overlapping recycling, the default, lets an unhealthy worker process become marked for recycling, but continues handling requests that this unhealthy process has already received. It does not accept new requests from HTTP.sys. When all existing requests are handled, the unhealthy worker process shuts down.

1. Open IIS Manager. For information about opening IIS Manager, see [Open IIS Manager \(IIS 7\)](#).
2. In the Connections pane, expand the server node and click Application Pools.
3. On the Application Pools page, select the application pool you want to recycle immediately.
4. In the Actions pane, click Recycle and then click Yes.

NEW QUESTION: 3

You must assign each server to at least _____ security group

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

Explanation

Your AWS account automatically has a default security group per region for EC2-Classical. When you create a VPC, we automatically create a default security group for the VPC. If you don't specify a different security group when you launch an instance, the instance is automatically associated with the appropriate default security group.
