NEW QUESTION: 3

Your network contains an Active Directory domain named contoso.com. The domain contains two sites named Site1 and Site2 and two domain controllers named DC1 and DC2. Both domain controllers are located in Site1.

You install an additional domain controller named DC3 in Site1 and you ship DC3 to Site2.

A technician connects DC3 to Site2.

You discover that users in Site2 are authenticated by all three domain controllers.

You need to ensure that the users in Site2 are authenticated by DC1 or DC2 only if DC3 is unavailable.

What should you do?

A. In Active Directory Sites and Services, modify the Query Policy of DC3.

B. From Network Connections, modify the IP address of DC3.

C. In Active Directory Users and Computers, configure the insDS-PrimaryComputer attribute for the users in Site2.

D. From Active Directory Sites and Services, move DC3.

Answer: D

Explanation:

A, Modifying IP will not effect authentication

B, A query policy prevents specific Lightweight Directory Access Protocol (LDAP) operations from adversely impacting the performance of the domain controller and also makes the domain controller more resilient to denial-of-service attacks.

C, DC3 needs to be moved to Site2 in AD DS

You plan to store delimited text files in an Azure Data Lake Storage account that will be organized into department folders.

You need to configure data access so that users see only the files in their respective department folder.

Solution: From the storage account, you disable a hierarchical namespace, and you use RBAC.

Does this meet the goal?

A. Yes

B. No

Answer: B

Explanation:

Explanation

Instead of RBAC use access control lists (ACLs).

Note: Azure Data Lake Storage implements an access control model that derives from HDFS, which in turn derives from the POSIX access control model.

Blob container ACLs does not support the hierarchical namespace, so it must be disabled.
